Tips to Build an Outstanding Dev Portfolio

1. Keep it simple

Simplicity Is the ultimate sophistication. Make your portfolio simple and easy to use. Avoid making it cluttered and complicated.

Skip all the unnecessary features and add-ons and instead keep the essential things in your portfolio: your work.

2. Mention Previous Job Experience

Have you had any jobs previously, or were you working as an intern? You can add these experiences to your portfolio. Mention things you had learned and any relevant information. Make sure it's appropriate to your field.

3. Present Only Your Best Work

You can put as many projects as you want. Still, people reviewing your portfolio won't spend their time reviewing all the projects, so you have to decide which projects are your best and only present them in your portfolio.

4. Downloadable Resume

You should make it simple for potential employers to download a copy of your resume and print it out if they want to.

Because many people still use hard-copy resumes today. So please add it.

5. Use a Tagline

Many portfolios have slogans like “Welcome to my portfolio,”, “Hi, I'm Adrian, and I'm a web developer,” etc.

Instead, you can use something strong and effective like “Empowering your web identity”, “We develop websites that ignite your business.” That tells visitors who you are and what you can offer them in a better way.

6. Make Sure to add links to your projects & code

Add live links to your projects; it's a great idea to show your clients the best work you've done so that clients can understand what you're capable of.

7. Include Testimonials or Reviews

Having testimonials or reviews from previous clients is best. Clients can naturally trust each other more than they trust just marketing collateral, so that testimonial adds more weight to the decision they're trying to make.

8. Share About Yourself

Add some personality to your portfolio. You can make a descriptive “About” page to learn more about you, your background, & your education. Also, make sure to link to your LinkedIn.

9. Show Your Awards & Acknowledgments

Have you ever been recognized for something outstanding? Share it in your portfolio.

The awards/recognition can be anything such as:

- winning a coding contest
- receiving an award in your local area (or online)
- Placing in a hackathon

But make sure it is relevant to your field.

10. Stay Consistent in Design

Consistency in design is about making elements uniform — having them look and behave the same way, for example, consistent navigation, consistent page layouts, or consistent control elements.

That consistency helps constantly prove a user's assumptions about the user interface, creating a sense of control, familiarity, and reliability.

11. Include a Contact Form

The most important part of your portfolio, apart from your work, is a contact form. People should be easily able to get in touch with you.

You can include a generic contact form on your website, and you should also add a way the visitors can get in touch with you—whether it's an email address or a phone number.

12. Get yourself a custom domain and suitable hosting

If you want your website to look professional, buy a professional domain. Don't use domains like '.netlify.app', '.vercel.app', etc.

I know many beginners can't afford a professional domain, but a professional domain always looks better than a subdomain.

Another great advantage of using a professional domain name is purchasing one domain name, creating subdomains, and pointing them to different projects—for example:

project.domain.com

I've partnered with Hostinger to offer you great hosting and domains at highly affordable rates.

13. Your Specialties and Services You Offer

You want to clarify what you do and specialize in on your portfolio since it can vary so much. If you create an eCommerce website for small businesses, mention that.

If you're passionate about React.js, let your clients know. Making your specialties crystal clear helps your potential clients.

14. Good Call to Action (CTA)

Please make sure you add a good amount of calls to action in your portfolio but also don't make it confusing for the visitor. Every call to action should have a purpose.

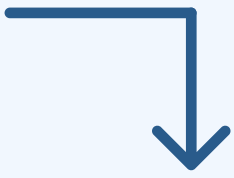

The examples of CTAs that you can add are a Contact Me CTA and a CTA to View Your Projects.

15. Keep the User Experience in Mind

I have seen a lot of portfolios where loading animation appears, and it lasts more than 15 - 30 seconds, and it's not a good user experience.

Like that, there are many things you should take care of, such as easy navigation, good background and text contrast, good call to action buttons, etc.

Some project ideas to put in your portfolio

Project Ideas

Real Estate App

Cryptocurrency App

Travel Companion App

ECommerce Web Shop

Voice Assistant News App

Social Media with CMS

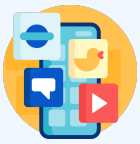

Voice Powered Budget Tracker

Blog App with CMS

Project Ideas

Social Media Web App

Modern UI/UX Website

Chat App

Video Chat App

Progressive Web Apps

Covid-19 Tracker App

Google Search Clone

Premium Landing Page

That's all for this guide
